INTERN PERFORMANCE ANALYTICS AND INSIGHTS DASHBOARD

SPRINT 1 – DATA COLLECTION AND PREPARATION

(High Level Documentation)

1.Data Collection and Simulation:

The data collection phase focused on gathering relevant and sufficient data required for analysing intern performance. Both primary and secondary data sources were used to ensure the dataset is meaningful and suitable for real-world analysis.

2. Data Structuring and Transformation:

After collecting the data, the next step focused on structuring the dataset into a proper analytical format. The aim was to convert raw, question-based input data into a clean and structured format suitable for analysis and visualization.

3. Data Formatting Using Power Bi:

The structured dataset was then processed using Power BI to ensure that all data types and formats were correct and ready for analysis.

4. Data Loading and Final Preparation:

After completing all transformations, the dataset was finalized and prepared for further analysis and dashboard creation.

INTERN PERFORMANCE ANALYTICS AND INSIGHTS DASHBOARD

SPRINT 1 – DATA COLLECTION AND PREPARATION

(Low Level Documentation)

1. Data Collection and Simulation:

Primary data was collected using Google Forms, where a structured form was created to capture details such as Name, Education, Gender, Department, Tasks Completed, Work Hours, Attendance, Performance Rating, Feedback, and Date. This form helped in collecting organized and consistent responses.

[Form link: https://docs.google.com/forms/d/e/1FAIpQLSdh0PAuPgmuKO5s8vQkiQ1J-_uMuLb-b5ERMbDDT0dWiA-c6A/viewform?usp=header]

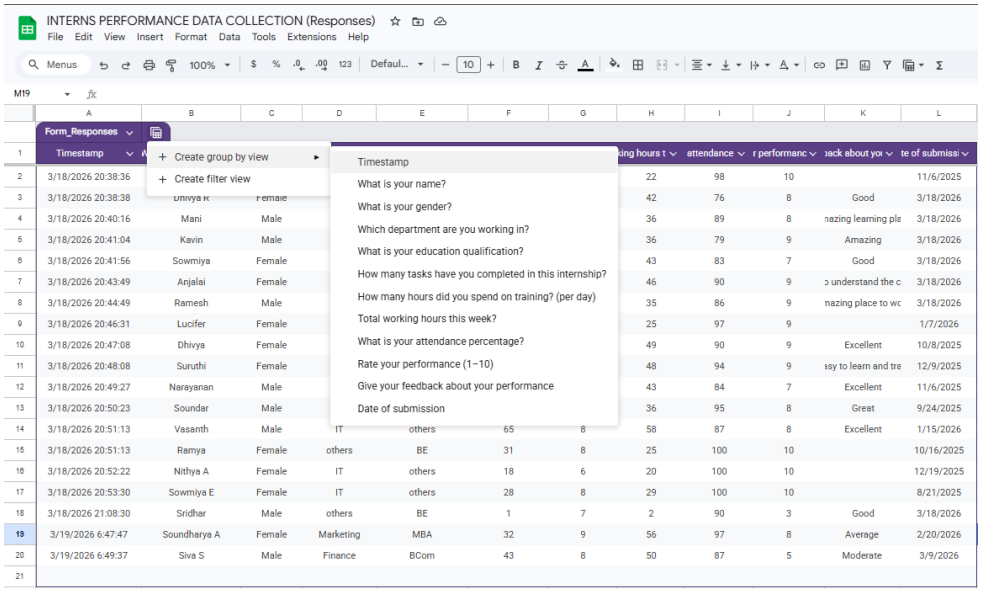
Secondary data was collected from Kaggle, including datasets are convert to have an intern performance data from my collection. (Employee_Performance.csv, hr_dashboard_data.csv – Datasets I've collected from Kaggle).

In addition, from the feature engineering techniques were using Excel formulas to enhance the analytical capabilities. These derived features included PERFORMANCE_CATEGORY, which categorizes interns based on their performance score; PRODUCTIVITY_RATIO, calculated as the ratio of tasks completed to work hours; ATTENDANCE_CATEGORY, based on attendance percentage; FEEDBACK_SENTIMENT, derived from textual feedback.

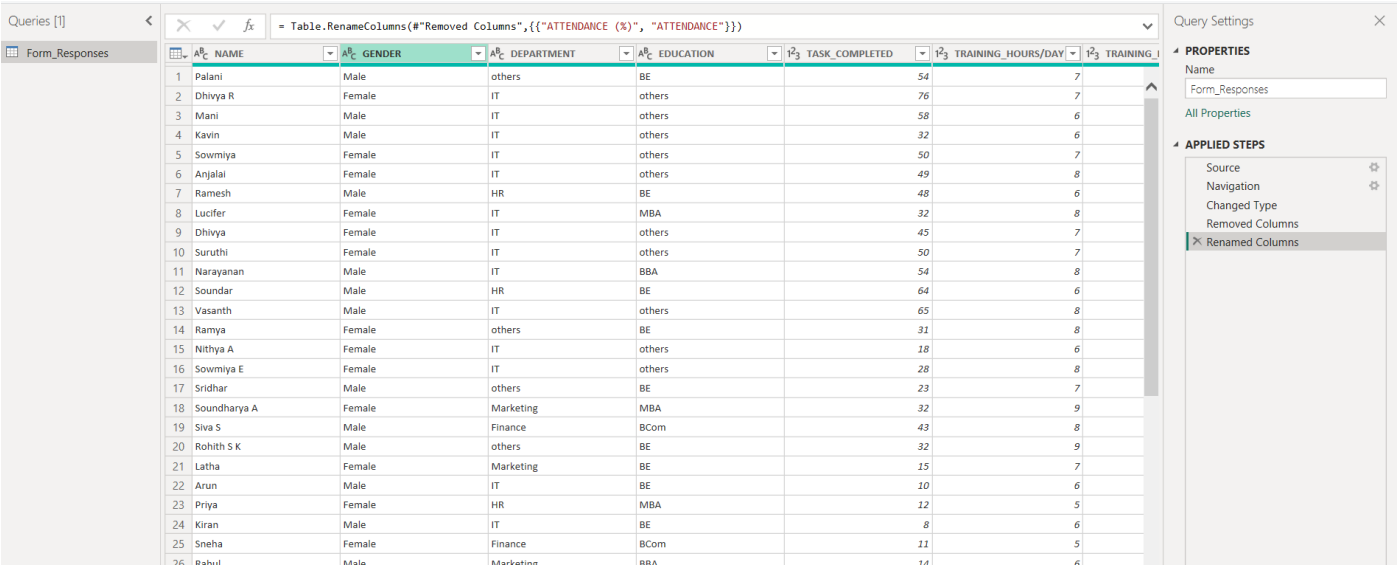
2. Data Structuring and Transformation:

the data collected from Google Forms was in a question-based format, where each field appeared as full questions. These were transformed into standardized column names such as Name, Education, Gender, Department, and other relevant attributes. This restructuring helped in making the dataset more readable and analysis-friendly.



3. Data Formatting Using Power Bi:

The dataset was imported into Power BI, and the Transform Data (Power Query) option was used to clean and format the data. In this step, column data types were corrected (such as text, numbers, and dates), unnecessary columns were removed, and any inconsistencies in the data were fixed. This ensured that the dataset was properly formatted for visualization.



4. Data Loading and Final Preparation:

Once the data transformation process was completed in Power BI, the cleaned dataset was saved and loaded into the Power BI environment. This step ensured that the final dataset was ready to be used for building dashboards and performing exploratory data analysis in the next sprint.
